DSA for Interviews — 6 Weeks

Everything you need to crack coding interviews at product companies. Pattern-first teaching — you learn to recognise the problem type, not just memorise solutions.

PRICE	DURATION	LEVEL	FORMAT	SCHEDULE
₹4,999	6 Weeks	Intermediate	Live + Recorded	Tue, Thu, Sat · 8 PM

Founder & Instructor, Qurious Academy

What is DSA for Interviews — 6 Weeks?

The dirty secret of technical interview preparation is that most candidates approach it the wrong way. They grind hundreds of LeetCode problems hoping patterns emerge through repetition — and then freeze in an interview when they see a problem that looks slightly different from what they practiced. This course teaches the opposite approach: pattern recognition first.

Over six weeks, you'll systematically learn the 15+ algorithmic patterns that cover the vast majority of problems asked in technical screens at product companies. Two pointers, sliding window, BFS/DFS, dynamic programming, backtracking — you'll know not just how to implement each pattern but how to recognise which one to reach for from the first few lines of a problem statement.

The course includes 100 curated problems, pattern cheat sheets, and three full mock interviews with detailed written feedback — the same structure used by candidates who successfully clear screens at top product companies. By Week 6 you'll be solving medium LeetCode problems consistently and approaching interviews with a structured, confident methodology.

IS THIS RIGHT FOR YOU?

Who Should Enroll

✓ THIS IS FOR YOU IF...

- ✓ You're preparing for technical interviews at product companies (startups, mid-size, or FAANG-adjacent) and want a structured, pattern-based preparation approach
- ✓ You've tried grinding LeetCode on your own and find yourself stuck on medium problems without a clear methodology
- ✓ You're a self-taught developer or recent graduate who has the coding skills but hasn't formally studied algorithms
- ✓ You have a specific interview coming up in 2–3 months and want a focused, accountable preparation structure

✗ THIS IS NOT FOR YOU IF...

- ✗ You can't write basic code — you need to be comfortable with variables, loops, functions, and basic data types in at least one programming language
- ✗ You're aiming exclusively for system design or behavioural interviews — this course focuses entirely on data structures and algorithm coding problems
- ✗ You want a comprehensive computer science degree curriculum — this course is scoped specifically to interview preparation, not academic completeness

Prerequisites: Python (or any language) basics — you must be comfortable with variables, loops, functions, and classes. No prior DSA or algorithm knowledge required.

Six Weeks, Four Modules, 15+ Patterns

WEEKS 1-2**Arrays, Strings & Hashing**

- ▶ **Two pointers** — the pattern for problems involving pairs, sorted arrays, and palindromes; left/right pointer and slow/fast pointer variants; when to recognise it
- ▶ **Sliding window** — fixed and variable-size windows for substring, subarray, and sequence problems; the template that solves an entire category of $O(n)$ problems elegantly
- ▶ **Hash maps & hash sets** — $O(1)$ lookup as a problem-solving tool; frequency counting, anagram detection, two-sum and its variants; the pattern behind dozens of common problems
- ▶ **Prefix sums & difference arrays** — precomputing cumulative sums to answer range queries in $O(1)$; the pattern behind subarray sum problems and range update operations

WEEK 3**Trees & Graphs**

- ▶ **Binary trees — traversals & properties** — inorder, preorder, postorder, and level-order traversals both recursively and iteratively; height, diameter, LCA, and path problems
- ▶ **Binary search trees** — BST properties, validation, insertion, deletion, and the range of interview problems that exploit BST ordering
- ▶ **DFS & BFS** — depth-first and breadth-first search as universal graph traversal patterns; when to use each; iterative DFS with a stack vs. recursive DFS
- ▶ **Graph representations & common patterns** — adjacency list vs. matrix, connected components, cycle detection, topological sort, and union-find for disjoint sets

WEEK 4**Recursion & Dynamic Programming**

- ▶ **Recursion patterns & call stack** — thinking recursively; the recursive leap of faith; identifying base cases and recursive cases; tracing through the call stack
- ▶ **Memoization (top-down DP)** — converting brute-force recursion to efficient DP by caching subproblem results; the pattern that makes exponential problems polynomial
- ▶ **Bottom-up DP with tables** — building DP tables iteratively; space optimisation; transitioning from memoization to tabulation for interview clarity
- ▶ **Classic DP problems** — knapsack (0/1 and unbounded), longest common subsequence, coin change, edit distance, and the decision framework for identifying DP problems

WEEKS 5-6**Advanced Topics & Mock Interviews**

- ▶ **Heaps & priority queues** — min-heap, max-heap, and the k-th element pattern; top-k problems, merge k sorted lists, and the heap as a running minimum/maximum structure

- **Tries** — prefix tree structure, word search, autocomplete, and problems requiring fast prefix lookups
- **Greedy algorithms** — the greedy choice property; recognising when locally optimal choices lead to globally optimal solutions; interval scheduling and activity selection
- **Backtracking** — the exhaustive search pattern for permutations, combinations, and constraint satisfaction; pruning techniques that make it practical
- **3 full mock interviews with written feedback** — conducted under real interview conditions; detailed written feedback on your problem-solving approach, communication, and code quality

LEARNING OUTCOMES

What You'll Walk Away With

01 Solve medium LeetCode problems consistently

— not every problem, but a reliable, systematic approach to medium-difficulty problems across all major categories

02 Recognise and apply 15+ algorithm patterns

— pattern recognition as the core skill; the ability to look at a new problem and identify which template applies

03 Perform confidently under interview conditions

— three mock interviews mean you've practised the communication, time management, and composure that live interviews require

04 Ready for technical screens at product companies

— the coverage, depth, and practice volume to pass first and second-round technical screens at most product companies

WHAT'S INCLUDED

Everything You Get

✓ **Live sessions + all recordings** — three sessions per week for six weeks; all recordings available permanently

✓ **100 curated problem list** — hand-picked problems organised by pattern, difficulty, and company frequency; the problems that actually appear in interviews

✓ **Pattern cheat sheet** — a single reference document covering all 15+ patterns with the recognition signals, template code, and complexity analysis for each

✓ **3 mock interviews with detailed feedback** — one-on-one mock interviews conducted under real conditions; written feedback on approach, communication, and code

✓ **Learner's Certificate** — digital certificate of completion from Qurious Academy

LIVE DAYS

Tuesday, Thursday, Saturday

TIME

8:00 PM – 9:30 PM IST

DURATION

6 weeks · 18 sessions · 27 hrs live

PRICE

₹4,999

Q Which programming language should I use?

The course teaches in Python — it's the most interview-friendly language for clarity. You can follow along in any language (Java, C++, JavaScript) but code examples and templates will be in Python.

Q How are the mock interviews scheduled?

Mock interviews are scheduled in Weeks 4, 5, and 6 based on your availability. They're conducted 1-on-1 over video call and last 45–60 minutes each.

Q Is this enough to crack FAANG interviews?

This course prepares you for the coding round at most product companies. Top-tier FAANG interviews (Google L5+, Meta E5+) also require system design preparation and harder algorithm problems. We recommend this as the DSA foundation, with additional hard problem practice for top-tier targets.

About Prasant Mishra

Prasant Mishra

Founder & Instructor — Qurious Academy

GenAI Solutions Architect

15+ Yrs Teaching

2500+ Students

60+ Projects Delivered

Prasant has both conducted technical interviews and prepared candidates for them over his career. He's seen which preparation strategies lead to consistent performance and which lead to candidates who can solve problems they've seen before but freeze on new ones. The pattern-first approach in this course is a direct response to that observation.

His focus in mock interviews is on the thinking process as much as the solution — because interviewers are evaluating how you think, communicate, and handle uncertainty, not just whether you get the right answer. The feedback he provides reflects that holistic view.

QuriousAcademy

Focused, live learning for curious minds. No fluff — just the concepts that matter.
